Minutes of Meeting & Requirements

Shree Guruji × Pucho.ai — System Demo & Scoping: CRM (Lead and Complaint Management), AI Image Deduplication and Task Management

Client	Shree Guruji	**Meeting Date**	28 September 2026
Convened by	Pucho.ai	**Mode**	Voice / virtual meeting
Client participants	Swapnil, Nidhir (Tushar, Business Owner, referenced)	**Pucho.ai participants**	Gaurav Sharma
Subject	CRM with lead and complaint management, AI image deduplication, task management	**Prepared by**	Pucho.ai Solution Architecture Team
Reference	PUCHO-MOM-LEAD-280926	**Language**	Hindi & English

1. Purpose of the Meeting

Pucho.ai met Swapnil and Nidhir of Shree Guruji to review the initial Pucho CRM prototype built for lead and complaint management, and to scope additional workflows. The discussion expanded to project-wise internal task management and an AI vision solution to detect duplicate auto-rickshaw branding photos. Tushar (Business Owner) was referenced for approval of the commercial proposals.

2. Discussion by Topic

2.1 Current Challenges

- **Manual lead entry** causes misspellings (for example city names), which breaks the filtering logic. An IVR / bot is needed to capture basic details before routing to human agents.
- **Marketing agencies** submit duplicate photos for auto branding, leading to wasted funds. AI vision to detect registration numbers will ensure accurate billing.

2.2 CRM and Lead Management

- The initial Pucho CRM prototype for lead and complaint management was reviewed and validated.
- Complaint management sits inside the Lead module: complaints are logged, assigned and tracked to closure in the same CRM as leads.
- Five standard lead stages: Open, In Progress, Closed, Rejected, Converted.
- Leads to be captured from Website, Email, Phone and, primarily, WhatsApp.
- Must include a kanban board, search by city / phone, and user-specific follow-up reminders.
- Pucho to investigate CTM (Call Tracking Metrics) or IVR integration to pre-capture City and Name, reducing manual spelling errors by operators.

2.3 AI Image Deduplication (Auto Branding)

- Analyse thousands of campaign photos supplied by marketing agencies (scale discussed: about 1,000 autos per campaign).
- Identify duplicate photos of the same auto-rickshaw based strictly on the vehicle registration number.
- The dashboard must flag and highlight duplicate submissions automatically.

+91 99507 99504 | gaurav.sharma@pucho.ai | https://www.pucho.ai | Usmanpura, Ahmedabad, Gujarat 380014

- Pucho needs 5–10 sample images from the client to build the custom detection logic.

2.4 Task Management (Internal)

- Project-wise grouping for internal task allocation.
- Automated WhatsApp reminders for overdue tasks (for example at 10 AM, 2 PM and 6 PM).

2.5 Commercials and Approval

- Pucho.ai will share commercial proposals for CRM, Vision and Tasks.
- The client team will discuss the proposals internally with Tushar for approval.

3. Decisions and Directions

#	Decision / direction
1	The CRM will use five standard stages: Open, In Progress, Closed, Rejected, Converted.
2	Pucho.ai will build an AI Image Deduplication demo once the client shares sample images.
3	Pucho.ai will check technical feasibility of IVR / CTM to CRM auto-fill.
4	Commercial proposals for CRM, Vision and Tasks will follow, for approval by Tushar.

4. Action Items

#	Action	Owner	Target
1	Share 5–10 sample auto images and detection criteria	Swapnil	To be confirmed
2	Develop and present AI Image Deduplication demo	Gaurav Sharma	To be confirmed
3	Check technical feasibility of IVR / CTM to CRM auto-fill	Gaurav Sharma	To be confirmed
4	Share commercial proposals for CRM, Vision and Tasks	Gaurav Sharma	To be confirmed
5	Discuss proposals internally with Tushar for approval	Client team	To be confirmed

5. Requirement Specification

5.1 Scope by Module

Module	Scope	Status
Module 1	CRM with lead and complaint management (5 stages, kanban, search, follow-up reminders, CTM / IVR pre-capture)	Scoped
Module 2	AI image deduplication for auto branding (registration-number based)	Scoped; demo pending sample images
Module 3	Task management with project-wise grouping and WhatsApp reminders (internal)	Scoped

5.2 Functional Requirements

A. CRM: lead and complaint management

- Maintain five stages: Open, In Progress, Closed, Rejected, Converted.
- Complaint management within the Lead module: log, assign and track complaints to closure alongside leads, with the same search and follow-up reminders.
- Capture leads from Website, Email, Phone and primarily WhatsApp.
- Kanban board; search by city and phone; user-specific follow-up reminders.
- CTM or IVR integration to pre-capture City and Name and reduce spelling errors (feasibility to be checked).

B. AI image deduplication (auto branding)

- Analyse thousands of campaign photos supplied by marketing agencies.
- Detect duplicate photos of the same auto-rickshaw strictly by vehicle registration number.
- Dashboard automatically flags and highlights duplicate submissions.

C. Task management (internal)

- Project-wise grouping for internal task allocation.
- Automated WhatsApp reminders for overdue tasks at set times (for example 10 AM, 2 PM, 6 PM).

5.3 Inputs Required from the Client

Input	Purpose	Owner
5–10 sample auto images and detection criteria	Build the custom duplicate-detection logic	Swapnil
WhatsApp Meta API access	Automated task reminders	Client / Pucho.ai
CTM / 800-number details	Call tracking and routing integration	To be confirmed

5.4 Integrations

System	Role in the flow	Owner / access
Pucho Platform	Core engine for CRM, workflows and AI vision	Gaurav Sharma
WhatsApp Meta API	Automated WhatsApp task reminders	Client / Pucho.ai
CTM / 800-number	Call tracking and routing integration	To be confirmed

5.5 Assumptions and Dependencies

- The AI image deduplication demo depends on the client sharing 5–10 sample images and detection criteria.
- The CTM / IVR approach depends on whether CTM pushes data to Pucho via API or Pucho builds the IVR logic internally.
- Automated task reminders depend on WhatsApp Meta API access.

6. Risks and Blockers

- Pending sample images block the AI image deduplication demo.
- Manual lead entry causes misspellings that break filtering, until CTM / IVR pre-capture is in place.
- Duplicate photos from marketing agencies lead to wasted spend until detection is live.

+91 99507 99504 | gaurav.sharma@pucho.ai | https://www.pucho.ai | Usmanpura, Ahmedabad, Gujarat 380014

7. Points to be Confirmed

- Will the CTM system push data via API to Pucho, or will Pucho build the IVR logic internally?
- CTM / 800-number ownership and access details.
- Commercials for CRM, Vision and Tasks, and the client's approval timeline.
- Target dates for sample images and the demo.

8. Agenda for the Next Meeting

1 Review of the sample auto images and detection criteria.

2 Demo of the AI Image Deduplication tool.

3 Update on IVR / CTM to CRM auto-fill feasibility.

4 Discussion of commercial proposals for CRM, Vision and Tasks.

Prepared by Pucho.ai from the meeting minutes dated 28 September 2026 (Ref: PUCHO-MOM-LEAD-280926). Corrections may be sent to gaurav.sharma@pucho.ai.
